

BACKEND TESTING

Database Reset	<code>flush_database()</code> exists to erase the database and re-run backend migrations to run the application from a clean slate.
GET Available Models	<code>test_get_models()</code> exists to validate the models endpoint by returning the model name and ids
GET Sessions	<code>test_get_sessions()</code> exists to validate the sessions endpoint by returning structured data about the prompt-response sessions
GET Stored Responses	<code>test_get_responses()</code> exists to verify responses are persistent and retrieval is possible
POST prompt to generate output	<code>test_post_prompt()</code> exists to check if the backend will return a response given a predetermined prompt
Interactive Test	<code>interactive_test()</code> exists so the user can check if a response is returned given a user-defined prompt

FRONTEND TESTING

Smoke test	<code>check_servers()</code> exists to verify the backend and frontend are available.
Index Routing	<code>test_frontend_index()</code> verifies the frontend index page is available
End to End Chat Test	<code>test_frontend_chat_endpoint()</code> validates HTTP status codes and prints part of the response for a pre-determined prompt
Interactive Test	<code>interactive_test()</code> mirrors the backend interactive test verifying the frontend and backend are working together to return a response given a user-defined prompt
